

ABSTRACT

A cabinet includes two side plates and one or more rear plates each having a channel formed by a flap, an upper plate secured on top of the side plates and the rear plates, an upper and a lower
5 beams secured between front portions of the side plates, and a bottom plate having two side flanges and a rear flange extended downwardly to engage into the channels of the side plates and the rear plates, and to latch and secure the bottom plate to the side
plates and the rear plates. Each of the flanges of the bottom plate
10 may further include one or more catches to engage into the flaps and to solidly secure the bottom plate to the side plates and the rear plates.
